Education

Virginia Tech (expected grad 2023)

GPA: 3.24 B.S. in Computer Science w/ Stat minor
Elective Courses: Restricted Research, Mathematical
Statistics 1-2 (Probability and Inference), Intro to Data
Analytics and Visualization

Gonzaga College High School (2015 - 2019)

GPA 3.98

Skills

Programming: Python, C, Java, R, Matlab

Frameworks: PyTorch, Scikit-learn, Keras, Numpy,
OpenCV, Pandas, Matplotlib, RLLib, OpenAI Gym

Other: deep learning, recurrent and convolutional neural
networks, reinforcement learning, GANs, autoencoders,
data analytics, statistical learning, Linux, Git,
Kubernetes, LaTeX, Agile

Work Experience

Research Assistant - Sanghani Center (Virginia Tech)

May. 2021 - present

- Working with Prof. Naren Ramakrishnan's group to create an open-source library of epidemiological models for forecasting the COVID-19 pandemic and the seasonal flu.

Research Assistant - BIST (Virginia Tech)

Nov. 2019 - present (school year)

- Working for the Center for Bioinspired Science and Technology under Prof. Rolf Mueller to use deep learning to facilitate robot navigation via biosonar
- Using convolutional neural networks to classify spectrograms based on their location inside the region we collected data from, with the goal of eventually creating an algorithm for navigating through the forest

Research Assistant - Hume Center (Virginia Tech)

Sept. 2019 - present (school year)

- Working under Prof. Daniel Doyle to train reinforcement learning agents on strategy games, with the goal of developing new mechanisms to improve training efficiency on very complex tasks.
- Previously designed and trained object-detecting convolutional neural network architectures, which achieved 97% accuracy on the classification phase of the Lockheed Martin AlphaPilot Dataset and were deployed to a drone's computer to aid in navigation

Machine Learning Engineer Intern - Decipher Technology Studios

2018 - 2020 (summers)

- Worked on a small team to develop Sense, a new product which provides deep reinforcement learning-powered predictive autoscaling for Decipher's service mesh platform
- Implemented a library of policy gradient, Q-Learning, and actor-critic approaches to deep reinforcement learning (DQN, DDPG, A2C, PPO, SAC, etc), as well as model improvements such as recurrent and convolutional layers, with PyTorch
- Wrote a microservice environment simulator for offline training with another intern and created a rule-based autoscaler to jumpstart training via imitation learning.
- Created infrastructure to deploy Sense as a service on Openshift and Elastic Kubernetes Service.

Activities

Judging Coordinator - VTHacks Organizing Team

2019 - present

- Responsible for recruiting faculty judges and managing judging logistics during the event.

Stage Manager - Gonzaga Dramatic Association Stage Crew

2017 - 2019

- Led a team of over 20 students in the construction of a structure over 20 ft. wide and 8 ft. tall
- Quickly diagnosed and fixed technical issues in a high-pressure environment

Participant and Mentor - HackBI (Bishop Ireton High School Hackathon)

2017 & 2018

- Won best overall in a programming contest by writing an app that makes use of machine learning and computer vision techniques to interpret hand-written text
- Returned to HackBI in 2018 to mentor teams and teach deep learning concepts

Projects

Computable AI - co-author of a blog on machine learning, writing a Fundamentals of Deep RL series

Machine Learning Templates - flexible PyTorch implementations of a supervised learning neural network, autoencoder, GAN, and evolutionary algorithm designed for future machine learning projects

Grease Lights and Magic Mirror - coded and designed circuits for custom Arduino and Raspberry Pi-based lighting effects and optical illusions featured in high school theater productions
